Engineer working across the LLM stack — from applied product features to model alignment data. Five years shipping production web systems, two years working directly with language models: LLM-driven evaluation and recommendation products, RLHF/SFT/DPO training data and systematic failure-mode analysis, and agent and retrieval systems built on RAG and vector search. TypeScript-first, Python-capable. Comfortable owning a feature end to end, from data pipeline to product surface.

SKILLS

AI / LLM LLM APIs (OpenAI) · agent design and tool calling · RAG and retrieval pipelines · vector databases and embeddings · prompt design & iteration · LLM-driven evaluation and recommendation systems · RLHF / SFT / DPO training-data creation · edge-case discovery and failure-mode analysis · OCR and text-extraction pipelines · Hugging Face

Languages TypeScript / JavaScript · Python · SQL

Backend Node.js · Nest.js · GraphQL · REST · PostgreSQL · MongoDB

Frontend React · Next.js · Tailwind CSS

Practice CI/CD · automated testing (Jest) · Docker · observability · code review · clean architecture

EXPERIENCE

AI Engineer — Independent Projects

03/2026 – Present

Self-directed

Yerevan

- Building an NLP corpus pipeline for Classical Armenian and an autonomous job-application agent (see Projects).
- Focus areas: agent tool design, RAG and retrieval pipelines over vector search, text-extraction from unstructured sources, and evaluating non-deterministic output.

Stack: TypeScript, Next.js, Node.js, Python, OpenAI API, vector database, RAG, OCR pipelines, Vercel

Software Engineer

11/2025 – 03/2026

Prostrive

Netherlands · Remote

- Built an Answer Engine Optimization (AEO) product that evaluates a client website with LLM-driven analysis and generates prioritized, actionable recommendations for improving how the site is surfaced and answered by search and AI systems.
- Designed the prompt pipeline behind the product: structured extraction of site state, followed by insight generation — iterating on prompt structure and output schemas to make results consistent and reviewable rather than free-form.
- Shipped the full product surface end to end: Next.js / React frontend, Nest.js / Node.js backend, PostgreSQL data models, and the API contracts between them.
- Integrated third-party services, including SDK configuration and webhook handling.
- Diagnosed and resolved performance bottlenecks across frontend rendering, API latency, and database queries.

Stack: TypeScript, Node.js / Nest.js, React / Next.js, PostgreSQL, OpenAI API, Docker

AI Training & Evaluation Engineer (contract)

05/2024 – 03/2025

Turing

US · Remote

- Produced training and preference data for RLHF, SFT and DPO pipelines — multi-turn conversations built around problems frontier models failed to solve correctly.
- Specialized in adversarial and edge-case discovery: identifying where model responses were incorrect, incomplete, or suboptimal, and characterizing the failure mode precisely enough to be actionable as training signal.
- Authored reference solutions to complex technical problems, used as gold-standard targets in reward modeling.
- Contributed to web application work on LLM-integrated products alongside the data pipeline, covering API contracts, data models, CI/CD and automated tests.

Stack: Python, JavaScript / TypeScript, Node.js / Nest.js, React / Next.js, Vue / Nuxt, GraphQL, PostgreSQL, MongoDB, Hugging Face, OpenAI API, Docker

Software Engineer

03/2022 – 12/2023

Hearst Autos

US · Remote

- Led full-lifecycle development of features across a high-traffic automotive web platform, owning delivery from design through production.
- Drove code quality through review, clean architecture patterns, and test coverage on a large shared codebase.

- Researched and implemented performance optimizations in collaboration with the team, improving system efficiency.
Stack: JavaScript, Node.js, React.js, Next.js, Vue.js, Jest, Python, GraphQL, MongoDB, PostgreSQL, Docker

Full-Stack Web Developer

Matemat

07/2020 – 07/2021

Yerevan, Armenia

- Delivered features across frontend and backend; implemented responsive interfaces from Figma designs.
- Built and maintained scalable APIs, and developed web scraping pipelines feeding data-driven product functionality.

Stack: JavaScript, Node.js, Vue.js, MongoDB, GraphQL, Elasticsearch

PROJECTS

Armenian NLP — corpus pipeline for a low-resource language: taragir.vercel.app

- End-to-end pipeline that turns scanned historical Armenian books into a structured, queryable corpus. Classical Armenian has no maintained NLP toolchain, and OCR engines trained on Latin scripts fail on historical Armenian typefaces.
- Built an OCR error taxonomy by hand-reviewing extracted output, then implemented targeted corrections for the script- and ligature-specific failure patterns — error analysis on genuinely messy real-world data.
- Normalizes across orthographic reforms, integrates an existing open-source morphological analyzer to annotate each form, and enriches entries with web-sourced attestations. Provenance is retained back to the source page.

Job Bot — autonomous job-application agent: web-rho-sable-74.vercel.app

- Agent that retrieves job postings, parses and scores them against a candidate profile, and drafts tailored applications — built around tool design, retrieval, and handling non-deterministic output reliably.

Foody — meal planning and inventory app: foody-front-vert.vercel.app

- Full-stack meal-planning application with inventory tracking and recipe suggestions; deployed and publicly available.

EDUCATION

Computer Science — Toulouse Paul Sabatier III University

2019 – 2023

Web Programming — AITC, EIF

2018 – 2019

Continuing education: JS Mastery — full-stack project intensives (2025) · Pluralsight — Advanced Node.js, Software Architecture & Microservices, GraphQL & Apollo (2023)

LANGUAGES

Armenian Native (C2) · English Advanced (C1) · French Intermediate (B1) · German Beginner (A1)
